# Deploying to Stripe

- I already had a stripe account so navigate to https://dashboard.stripe.com
- If you use your stripe account for real transactions make sure you set the mode to developers and test mode 'ON' as below.

- To setup an endpoint it is the same as setting up the previous one for our test environment navigate to the tab below.

- Choose 'add endpoint' and configure the address to the above and select it to monitor for all events.
- Now we just need to copy our signing secret and paste it in
  Into a new variable called 'STRIPE_WH_SECRET' inside in our config vars in Heroku.

- There is no option to send a test webhook any more so just put through a transaction as normal to test.
- This completes the Stripe signup.
